

OVERHEAD CRANE AND LIFTING GEAR MAINTENANCE

SERVICE

Since 2017, Rubberplast, having acquired the business branch of a mechanical company that carried out this activity within the industrial park of Rosignano, in addition to having strengthened the plant engineering and assembly part, has started to offer the service of checking and maintenance of overhead cranes and lifting equipment (manual and electric hoists, overhead cranes, jib cranes, motors and gearmotors with variable speed, travel-lifts, etc.). Therefore, our company acts as a qualified supplier in the area, capable of performing both ordinary maintenance (quarterly and annual checks, assistance for ASL inspections, cleaning and greasing, troubleshooting), and extraordinary maintenance (gearbox overhaul, gearbox oil replacement, brake maintenance and replacement, festoon line maintenance and replacement, wheel replacement maintenance, rope and cable replacement, raceway replacement). In particular, we already have in place the following bridge crane and lifting equipment maintenance contracts lifting equipment:

- Bridge crane maintenance contract with Solvay Spa
- Bridge crane maintenance contract with Inovyn Spa
- Bridge crane maintenance contract with Ineos Spa
- Bridge crane maintenance contract with Termisol Spa
- Bridge crane maintenance contract with Piaggio Spa
- Bridge crane maintenance contract with Engie Spa

Our maintenance work on plants (overhead cranes, hoists, overhead cranes, jib cranes, travel lifts and all lifting equipment) strictly follows the regulations in force, according to which companies that use such plants and equipment are obliged to carry out an accurate periodic inspection of lifting equipment (Presidential Decree 547/55 Art. 179 - Ministerial Decree 12/9/59 Art. 11-12).

In accordance with Presidential Decree 547/55 Art. 179 (Quarterly inspection of ropes and chains of lifting devices), maintenance contracts include a minimum of

4 interventions per year, every three months, for routine maintenance operations, including:

- Check of the functioning of all electrical and mechanical parts;
- Retrieval and check of consumables;
- Check of the state of use of ropes and chains

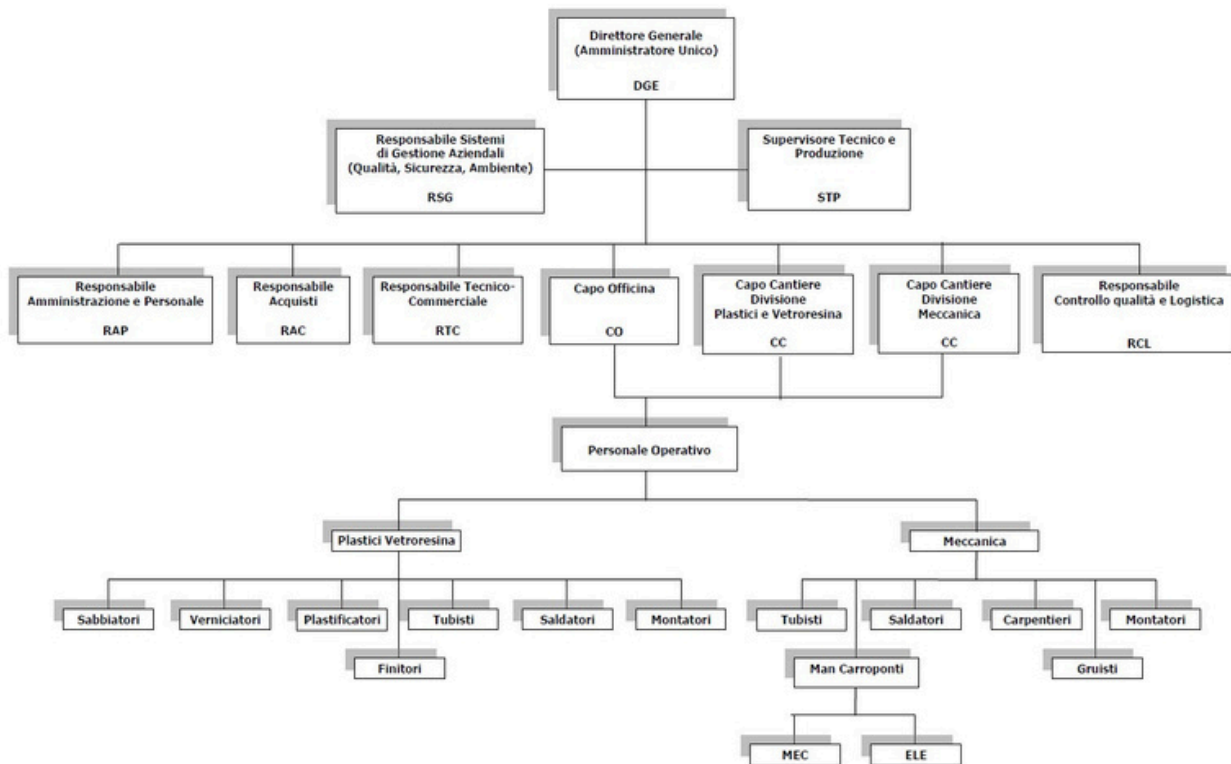

The intervention, as stipulated in the relevant regulations, will be recorded in the system's Use and Maintenance Booklet, as well as in the machine sheets we have compiled.

Entering into a preventive maintenance contract with our company means protecting yourself from unforeseen breakdowns, which always equate to plant downtime, i.e. lost revenue and high costs for the customer.

Rubberplast makes its skills and professionalism available (our employees are of proven experience and all have PES-PEI-PAV qualification) to also respond to requests for plant modifications: interventions that more often than not prove to be of fundamental importance in the production cycle of a company, as they are mainly aimed at facilitating or facilitating work, maximising safety, and increasing production force. The following are some of the works involved in technological upgrades and plant modifications:

- Addition of radio control
- Mechanical and/or electrical modifications to the crane structure
- Inhibition of transit zones
- Redevelopment of electrical installations
- Modification of crane gauge
- Decreasing/increasing capacity
- Replacement of hoist trolley on overhead crane
- Supply of under-hook tie-rods and crossbeams
- Repairs and structural checks on the load-bearing structures of lifting devices
- Repairs and replacements of structural steelwork of lifting devices.
